Advances in Cognitive Radio Systems

Cheng-Xiang Wang 2012-07-05 Cognitive radio technologies are forms of wireless communication with many and varied applications. The contributions in this book will benefit researchers and engineers as they offer cutting-edge knowledge in

the field. Subjects include uses of wideband voltage controlled oscillators, control planes for spectrum access and mobility in networks with heterogeneous frequency devices. Other chapters cover cognitive media access control and measurement methods for spectrum occupancy. In addition, there are

contributions on delay analysis and channel selection in single-hop networks for delay-sensitive applications, the application of transmission security (TRANSEC) protocols to cognitive radio communication and the use of blind detection, parameters, estimation and the despreading of DS-CDMA signals in multirate, multiuser cognitive radio systems.

Decision Making and Forecasting

Kneale T. Marshall 1995 This book discusses how to design the most important features of realistic decision problems into analytical models that reveal their structure and give insight. Emphasis is on model formulation using graphical techniques with influence diagrams and decision trees. Decision Making

and Forecasting shows how forecasting must be integrated with decision making in a coherent manner and makes frequent use of the economic value of forecasts.

Client-centered and Experiential Psychotherapy in the Nineties Germain Lietaer 1990 This voluminous book of 47 chapters offers a good cross section of what is burgeoing in the field of client-centered and experiential psychotherapy on the threshold of the nineties. it does not represent a single vision but gives the floor to the various suborientations: classics Rogerians; client-centered therapists who favor some form of integration or even eclecticism; experiential psychotherapists for whom Gendlin's focusing approach is a precious way

of working; client-centered therapists who look at the therapy process in terms of information-processing; existentially oriented therapists... Remarkable is that - for the first time in the history of client-centered/experiential psychotherapy - the European voice rings through forcefully: more than half of the contributions were written by authors from Western Europe. Several chapters contain reflections on the evolution—past, present, and future—of client-centered/experiential psychotherapy. The intensive research into the process, which had a central place in the initial phase of client-centered therapy, is given here ample attention, with several creative studies and proposals for renewal. In numerous contributions efforts are

made to build and further develop a theory of psychopathology, the client's process, the basic attitudes and task-oriented interventions of the therapist. The chapters dealing with clinical practice typically aim at the description of therapy with specific client populations and particularly severely disturbed clients. And finally a few fields are introduced which are new or barely explored within the client-centered/experiential approach: working with dreams, health psychology, couple and family therapy.

Now featuring analysis of the five-time Super Bowl champion New England Patriots and their captain, Tom Brady
The seventeen most dominant teams in sports history had one thing in common: Each employed the same type of captain—a singular leader with an unconventional set of skills and tendencies. Drawing on original interviews with athletes, general managers, coaches, and team-building experts, Sam Walker identifies the seven core qualities of the Captain Class—from extreme doggedness and emotional control to tactical aggression and the courage to stand apart. Told through riveting accounts of pressure-soaked moments in sports history, *The Captain Class* will challenge your assumptions of what

Interpretable Machine Learning

Christoph Molnar 2020 This book is about making machine learning models and their decisions interpretable. After exploring the concepts of

interpretability, you will learn about simple, interpretable models such as decision trees, decision rules and linear regression. Later chapters focus on general model-agnostic methods for interpreting black box models like feature importance and accumulated local effects and explaining individual predictions with Shapley values and LIME. All interpretation methods are explained in depth and discussed critically. How do they work under the hood? What are their strengths and weaknesses? How can their outputs be interpreted? This book will enable you to select and correctly apply the interpretation method that is most suitable for your machine learning project.

Knowledge Factors Felix J. Schmitz-Justen 2006 Knowledge is becoming more and more important as an individual good, and as a social and economic resource. The research project outlined in this publication focuses on the question how knowledge processes can be optimally stimulated in the cooperative context of forum-based Online Knowledge Communities (OKCs). Starting point of the research is a literature review and the outline of individual hypotheses on the basis of an interdisciplinary body of research from the fields of computer and management science. Following the literature review, an empirical study is presented and discussed. The empirical parts is founded on an Univariate Analysis of Variance (Anova)-based calculation of knowledge process contribution values

and a Structural Equation Model analysis (Sem)-based hypotheses test of individual factors of impact on individuals' knowledge process contributions. The publication integrates existing, fragmented research into an integrated model of forum-based collaborative knowledge management.

Farming James W. Wood 2020-04-23
Viewing the subsistence farm as primarily a 'demographic enterprise' to create and support a family, this book offers an integrated view of the demography and ecology of preindustrial farming. Taking an interdisciplinary perspective, it examines how traditional farming practices interact with demographic processes such as childbearing, death, and family formation. It includes topics such as household nutrition, physiological work capacity, health and resistance to infectious diseases, as well as reproductive performance and mortality. The book argues that the farming household is the most informative scale at which to study the biodemography and physiological ecology of preindustrial, non-

commercial agriculture. It offers a balanced appraisal of the farming system, considering its strengths and limitations, as well as the implications of viewing it as a 'demographic enterprise' rather than an economic one. A valuable resource for graduate students and researchers in biological and physical anthropology, cultural anthropology, natural resource management, agriculture and ecology.

The hierarchy of caste is not about feelings or morality. It is about power—which groups have it and which do not.” In this brilliant book, Isabel Wilkerson gives us a masterful portrait of an unseen phenomenon in America as she explores, through an immersive, deeply researched narrative and stories about real people, how America today and throughout its history has been shaped by a hidden caste system, a rigid hierarchy of human rankings. Beyond race, class, or other factors,

there is a powerful caste system that influences people's lives and behavior and the nation's fate. Linking the caste systems of America, India, and Nazi Germany, Wilkerson explores eight pillars that underlie caste systems across civilizations, including divine will, bloodlines, stigma, and more. Using riveting stories about people—including Martin Luther King, Jr., baseball's Satchel Paige, a single father and his toddler son, Wilkerson herself, and many others—she shows the ways that the insidious undertow of caste is experienced every day. She documents how the Nazis studied the racial systems in America to plan their out-cast of the Jews; she discusses why the cruel logic of caste requires that there be a bottom rung for those in the middle to measure themselves

against; she writes about the surprising health costs of caste, in depression and life expectancy, and the effects of this hierarchy on our culture and politics. Finally, she points forward to ways America can move beyond the artificial and destructive separations of human divisions, toward hope in our common humanity. Beautifully written, original, and revealing, *Caste: The Origins of Our Discontents* is an eye-opening story of people and history, and a reexamination of what lies under the surface of ordinary lives and of American life today.

Creative Imagery Ronald A. Finke
2014-02-25 Bringing together the results of experiments on discovery and invention in visualization conducted by the author over a three year period, this book reports new findings on the generation of creative inventions and concepts using mental imagery, and proposes a reconceptualization of the creative process. Creative Imagery introduces the concept of “preinventive forms” and describes an approach to creative invention differing from those typically used in problem-solving studies. There are two unique features of this book. First, it combines the experimental methods of cognitive science with the opportunity to explore and discover creative inventions in imagination. Second, it provides readers with

numerous opportunities to use the creative imagery techniques to develop their own inventions and conceptual discoveries. This text is of particular interest to scientists working in the fields of experimental psychology, cognitive psychology, and cognitive science. The techniques for generating creative inventions will also be of interest to people working in engineering, architectural design, and the visual arts.

analytical methods have emerged as the most promising solution to many of these complex problems. Indeed, the retail industry has emerged as a fascinating choice for researchers in the field of supply chain management. In *Retail Supply Chain Management*, leading researchers provide a detailed review of cutting-edge methodologies that address the complex array of these problems. A critical resource for researchers and practitioners in the field of retailing, chapters in this book focus on three key areas: (1) empirical studies of retail supply chain practices, (2) assortment and inventory planning, and (3) integrating price optimization into retail supply chain decisions.

Eigenvalue Fluctuations of Random Matrices Beyond the Gaussian Universality Class Elliot Paquette 2013 The goal of this thesis is to develop one of the threads of what is known in random matrix theory as universality, which essentially is that a large class of matrices generalizing the Gaussian matrices (certain Wigner matrices and beta-ensembles) show the same limiting behavior as the Gaussian ensembles. The more well known thread is the universality of local eigenvalue statistics, which is most directly tied to the physical roots of the theory. The other thread is the universality of the fluctuations of global eigenvalue statistics, which occurs in the same classes of

matrices that show the local universality. We focus on this second type of universality, and we analyze in detail some features of the limiting Gaussian process that arises this way. Beyond that, the mathematical contributions of this thesis are in three different models of random matrices, twice visiting linear statistics and once visiting the correct order scaling of the spectrum. In all cases, the ensembles studied do not fall into a matrix class covered by current, broad universality theorems. The closest of these models to the Gaussian class is the $[\beta]$ -Jacobi ensemble. It lies firmly in the environment of classical random matrix theory in that it can be defined by a log-gas with potential $V(x) = -(p-1)\log(x) - (q-1)\log(1-x)$ for some p and q . From

the standpoint of Johansson's results, the interest here is to see if the singular constraining potential is strong enough to disrupt the global fluctuations. We see that this is not the case, and the same formula for CLTs of linear statistics holds. We additionally find the limiting level density, and we find the first order correction to the limiting level density, which is also obtained by Johansson. The next of these models is the adjacency matrix of a permutation model regular graph. This matrix can be defined by sampling independently and uniformly permutation matrices $P_1, P_2, \dots, P_{[d]}$ and defining $P_{[n, d]} := P_1 + P_1^{[t]} + P_2 + P_2^{[t]} + \dots + P_{[d]} + P_{[d]}^{[t]}$.

For this matrix we will show how to derive a uniform bound on the eigenvalues that holds for all n and d and show how this bound can be used in conjunction with estimates on the number of non-backtracking walks to derive the law of the global fluctuations. In this setting, the dependence of d on n is seen to govern whether or not the d -regular graph has Gaussian-type global fluctuations. If d grows to infinity slowly as n goes to infinity, then the fluctuations are like the GOE. On the other hand, if d remains fixed, the fluctuations are a Poissonian analogue. Finally, we will investigate the normalized Laplacian L of the Erdos-Rényi graph model, a graph on n vertices with edges included independently and with probability $p=p(n)$. The behavior of

this object depends strongly on whether or not the degrees are strongly concentrated around their means. Indeed, the most interesting features of this graph from the spectral point of view arise precisely when the degrees stop being strongly concentrated. When all the degrees are concentrated, (the $p = \Omega(\log n / n)$ regime), then the nontrivial eigenvalues of L are within a $1/\sqrt{np}$ window of 1, consistent with GOE predictions. Outside of this regime, the answer is less clear. If p is exactly $\log n / n$, the graph has isolated vertices with probability tending to $1/e$. If the graph has isolated vertices, then L has eigenvalue 0 with multiplicity greater than 1, violating GOE predictions. This thesis will

*Downloaded from
www.seereerpodcast.org on October 2,

estimate the nontrivial eigenvalues of L as p descends to $\log n / n$ and attempt to determine their order. Each of these problems has additional motivations outside of the scope of exploring the Gaussian universality class. Each problem will be presented with its own history and motivation in addition to its contribution to understanding the broader picture.

In addition, the book details a variety of reliability analysis methods that are needed during all stages of a safety-critical system, beginning with specification and design and advancing to operations, maintenance, and modification control. The key categories of safety life-cycle phases are featured, including strategies for the allocation of reliability performance requirements; assessment methods in relation to design; and reliability quantification in relation to operation and maintenance. Issues and benefits that arise from complex modern technology developments are featured, as well as: Real-world examples from large industry facilities with major accident potential and products owned by the

general public such as cars and tools. Plentiful worked examples throughout that provide readers with a deeper understanding of the core concepts and aid in the analysis and solution of common issues when assessing all facets of safety-critical systems. Approaches that work on a wide scope of applications and can be applied to the analysis of any safety-critical system. A brief appendix of probability theory for reference with an emphasis on how safety-critical functions are introduced into systems and facilities to prevent or mitigate the impact of an accident, this book is an excellent guide for professionals, consultants, and operators of safety-critical systems who carry out practical, risk, and reliability assessments of safety-critical systems.
